EFFECTS**

# A palette of solutions that run the extra mile

With our Colors & Effects brand, BASF offers a comprehensive range of solutions for intense colors in your plastics. Specially designed for the easy processing of PO, rubber and engineering plastics, our pigment preparations improve polymer operations, resulting in reliable performance, improved working conditions, fast processing and the efficient use of working capital.

# Explanation of data

## Color shades

All organic pigment shades shown here are based on a full shade concentration of 0.2% powder pigment; violets are an exception, where 0.1% powder pigment was used. In the white reductions, the illustrations are based on the respective powder pigment concentration to achieve 1/3 ISD based on 5% TiO<sub>2</sub>.

Inorganic pigment shades are based on a full shade concentration of 2% powder pigment and a ratio of 1:4 for white reductions.

## Application performance

A selection of performance data of the most important properties in polyolefin (HDPE) is presented here. All data given is for the corresponding base pigment, unless otherwise stated. Pigment concentrations used are those based on powder pigments.

Organic pigments:

Full shade (FS): 0.1%

White reduction (WR): 0.1% + 1% TiO<sub>2</sub> (ratio 1:10)

Inorganic pigments:

Full shade (FS): 1%

White reduction (WR): 0.5% + 2% TiO<sub>2</sub> (ratio 1:4)

## Heat resistance (HDPE)

Heat resistance was determined by injection molding in accordance with ISO 12877-2.

The results show the highest temperature at which the color difference, versus a standard, is no greater than GS 4 on the ISO 105-A02 grayscale for assessing color change.

For most of the inorganic pigments and some high-performance organic pigments, a GS rating of 5 is achieved at the highest testing temperature of 300 °C. Therefore, heat resistance above 300 °C can be achieved under certain circumstances.

## Polymer suitability

Possible fields of application are shown in the table, opposite each pigment. Please note that these are intended only as a general guide.

The group of technical polymers includes styrenics as well as engineering plastics. It is advisable to check the suitability of the technical polymer for the desired pigment preparations with the respective pigments, as described in the pattern book for organic and inorganic pigments for plastics.

### Migration (HDPE)

Migration resistance was determined in accordance with DIN 53775 by direct contact between the colored test sheet and a white, flexible PVC contact sheet.

Staining of the contact sheet was assessed using the ISO 105-A03 grayscale (GS) for assessing staining, with GS 5 denoting no migration and steps 1 to 5 being subdivided.

### Light fastness (HDPE)

Light fastness was determined using Xenon lamp exposure tests in accordance with the equivalent test methods ISO 4892-2 or ISO 105-B02.

The samples were assessed against the 1–8 Blue Wool Scale as described in ISO 105-B02, Blue Wool 8 denoting the highest light fastness.

### Weather resistance (HDPE)

Weather resistance was determined using Xenon light exposure tests in accordance with the equivalent test methods ASTM G155, ISO 4892-2, or the internal test method WOM 119/50.

The HDPE samples were exposed for up to 3,000 hours.

Color changes were assessed using the ISO 105-A02 grayscale (GS) for assessing color change, with GS 5 denoting no change and GS 1 denoting the lowest weather resistance.

### Warping (HDPE)

Influence on the warping tendency of injection-molded HDPE articles was determined in accordance with ISO 294-4/ASTM D955.

Warping tendency was assessed as follows:

- None (N): No significant influence under laboratory test conditions and widely confirmed in practice.
- Low (L): Slight influence determined in laboratory testing but successful in practice.
- High (H): Significant influence in the laboratory and in practice. Use for large or complex HDPE injection moldings is not recommended.

### Pigment content

Average pigment concentration [%] in the respective concentrate is a nominal value. This value is intended only as a guideline. In practice, the specifications for the pigment preparations are set to achieve the correct color appearance and color strength.

### Bulk density

Bulk density was determined by the weight of a product sample that can be contained in a vessel of specified volume and is expressed as kg/l. Assessment was in accordance with ISO/R 787-11.

# Our pigment preparations are designed to make your life easier

Our broad range of pigment preparations for polyolefins, rubber and selected engineering plastics supports most applications – from prolonged outdoor exposure to the most stringent food packaging requirements. Customers can expect consistent processing behavior, reduced scrap rates, and enhanced productivity.

## Key portfolio

### Microlen® MCN

Microlen® MCN is a new product range based on organic pigments and carbon black incorporated in a low molecular-weight polyethylene homo-polymer at a concentration between 40% and 65%. These products are suitable for polyolefin, rubber and for certain engineering plastics (e.g. polyacetal or styrene copolymers). Microlen® MCN represents the utmost level of dispersion for a pigment in aforementioned applications.

Demanding applications in terms of technical requirements (e.g. thin films/ fibers or bottle crates), but also in sensitivity (e.g. food packaging) can be colored with the new sustainable product range Microlen® MCN.

### Eupolen® PE

The Eupolen® PE range is based on organic and inorganic pigments as well as carbon black incorporated in a polyolefin carrier at a concentration of between 30% and 65%, depending on the base pigment. Eupolen® PE products are suitable for polyolefin and for certain engineering plastics, and can be delivered in fine powder, micro-bead or granule form.
